RWorksheet_Palabrica#4a

Marvin Luiz Palabrica

2024-10-18

1. The table below shows the data about shoe size and height. Create a data frame.

```
table <- data.frame(
  Shoe_size = c(6.5, 9.0, 8.5, 8.5, 10.5, 7.0, 9.5, 9.0, 13.0, 7.5,
                10.5, 8.5, 12.0, 10.5, 13.0, 11.5, 8.5, 5.0, 10.0, 6.5,
                7.5, 8.5, 10.5, 8.5, 10.5, 11.0, 9.0, 13.0),

  Height = c(66.0, 68.0, 64.5, 65.0, 70.0, 64.0, 70.0, 71.0, 72.0, 64.0,
             74.5, 67.0, 71.0, 71.0, 77.0, 72.0, 59.0, 62.0, 72.0, 66.0,
             64.0, 67.0, 73.0, 69.0, 72.0, 70.0, 69.0, 70.0),

  Gender = c("F", "F", "F", "F", "M", "F", "F", "F", "M", "F",
             "M", "F", "M", "M", "M", "M", "F", "F", "M", "F",
             "F", "M", "M", "F", "M", "M", "M", "M")
)
table
```

```
##    Shoe_size Height Gender
## 1        6.5   66.0      F
## 2        9.0   68.0      F
## 3        8.5   64.5      F
## 4        8.5   65.0      F
## 5       10.5   70.0      M
## 6        7.0   64.0      F
## 7        9.5   70.0      F
## 8        9.0   71.0      F
## 9       13.0   72.0      M
## 10       7.5   64.0      F
## 11      10.5   74.5      M
## 12       8.5   67.0      F
## 13      12.0   71.0      M
## 14      10.5   71.0      M
## 15      13.0   77.0      M
## 16      11.5   72.0      M
## 17       8.5   59.0      F
## 18       5.0   62.0      F
## 19      10.0   72.0      M
## 20       6.5   66.0      F
## 21       7.5   64.0      F
## 22       8.5   67.0      M
## 23      10.5   73.0      M
## 24       8.5   69.0      F
## 25      10.5   72.0      M
## 26      11.0   70.0      M
```

```
## 27       9.0   69.0      M
## 28      13.0   70.0      M
```

a. Describe the data.

- The data contains measurements of 28 person which include their heights, shoe sizes, and genders. The shoe sizes range from 5.0 to 13.0, while heights vary from 59.0 to 77.0 inches.

b. Create a subset by males and females with their corresponding shoe size and height.

What its result? Show the R scripts.

```
males <- subset(table, Gender == "M", select = c(Shoe_size, Height))
females <- subset(table, Gender == "F", select = c(Shoe_size, Height))

males
```

```
##    Shoe_size Height
## 5       10.5   70.0
## 9       13.0   72.0
## 11      10.5   74.5
## 13      12.0   71.0
## 14      10.5   71.0
## 15      13.0   77.0
## 16      11.5   72.0
## 19      10.0   72.0
## 22       8.5   67.0
## 23      10.5   73.0
## 25      10.5   72.0
## 26      11.0   70.0
## 27       9.0   69.0
## 28      13.0   70.0
```

```
females
```

```
##    Shoe_size Height
## 1        6.5   66.0
## 2        9.0   68.0
## 3        8.5   64.5
## 4        8.5   65.0
## 6        7.0   64.0
## 7        9.5   70.0
## 8        9.0   71.0
## 10       7.5   64.0
## 12       8.5   67.0
## 17       8.5   59.0
## 18       5.0   62.0
## 20       6.5   66.0
## 21       7.5   64.0
## 24       8.5   69.0
```

c. Find the mean of shoe size and height of the respondents. Write the R scripts and its result.

```
MeanShoeSize <- mean(table$Shoe_size)
MeanShoeSize
```

```
## [1] 9.410714
```

```
meanHeight <- mean (table$Height)
meanHeight
```

```
## [1] 68.57143
```

d. Is there a relationship between shoe size and height? Why?

- Yes, there is a relationship between the shoe size and height of the respondents for the reason that the the shoesize aligns to their height.

2. Construct character vector months to a factor with factor() and assign the result to factor_months_vector. Print out factor_months_vector and assert that R prints out the factor levels below the actual values.

Consider data consisting of the names of months: "March","April","January","November","January", "September","October","September","November","August", "January","November","November","February","May","August,"J April"

```
months_vector <- c("March","April","January","November","January", "September","October","September","N
"January","November","November","February","May","August","July", "December","August","August","Septembe
"April")
 factor_months_vector <- factor (months_vector)
 factor_months_vector
```

```
##  [1] March     April     January   November  January   September October
##  [8] September November  August    January   November  November  February
## [15] May       August    July      December  August    August    September
## [22] November  February  April
## 11 Levels: April August December February January July March May ... September
```

3. Then check the summary() of the months_vector and factor_months_vector.

```
summary(months_vector)
```

```
##    Length     Class      Mode
##        24 character character
```

```
summary(factor_months_vector)
```

```
##     April    August  December  February   January      July     March       May
##         2         4         1         2         3         1         1         1
##  November   October September
##         5         1         3
```

Interpret the results of both vectors. Are they both equally useful in this case?

-Yes, the are both equally useful in this case.

4. Create a vector and factor for the table below.

```
factor_data <-c("East","West","North")
levels <- c(1, 4, 3)

factor_data
```

```
## [1] "East"  "West"  "North"
```

```
levels
```

```
## [1] 1 4 3
```

```
new_order_data <- factor(factor_data,levels = c("East","West","North"))
print(new_order_data)
```

```
## [1] East  West  North
## Levels: East West North
```

5. Enter the data below in Excel with file name = import_march.csv

a. Import the excel file into the Environment Pane using read.table() function. Write the code.

View the data set. Write the R scripts and its result.

```
library(readr)
import_march <- read_csv("/cloud/project/import_march.csv")
```

```
## Rows: 6 Columns: 4
## -- Column specification --------------------------------------------------------
## Delimiter: ","
## chr (1): Students
## dbl (3): Strategy 1, Strategy 2, Strategy 3
##
## i Use `spec()` to retrieve the full column specification for this data.
## i Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

```
import_march
```

```
## # A tibble: 6 x 4
##   Students `Strategy 1` `Strategy 2` `Strategy 3`
##   <chr>           <dbl>        <dbl>        <dbl>
## 1 Male                8           10            8
## 2 <NA>                4            8            6
## 3 <NA>                0            6            4
## 4 Female             14            4           15
## 5 <NA>               10            2           12
## 6 <NA>                6            0            9
```
